The resulting immunoconjugate comprising the toxin can be used to kill HIV infected cells and to treat HIV infected subjects to reduce the population of HIV infected cells. It can also be used to reduce the likelihood of infection. The immunoconjugate comprising the radionuclide can be used to image HIV infected tissue, to calculate the stage of HIV infection or the efficacy of an anti-HIV treatment using the imaging technique and for determining the prognosis of an HIV infected subject. (Updated on 25-MAR-2003 to correct PN field.)

                                                                                                                                                                                           This sequence represents the human CD4-gamma 2 chimeric heavy chain CC immunoconjugate comprising a cytotoxic radionuclide and a heterotetramer of two heavy chains and two light chains. The cytotoxic radionuclide is CC linked to either the heavy chains or the light chains, or to all four C chains, directly or through a bifunctional chelator. Both heavy chains CC are chimeric CD4-Ig (immunoglobulin) G2 chains encoded by vector CD4-CC [G2HC-pRcCMV (ATCC 75193) and both light chains encoded by vector CD4-CC chains are chimeric CD4-Ig (immunoglobulin) G2 chains encoded by vector CD4-CC [G2HC-pRcCMV (ATCC 75193) and both light chains are chimeric CD4-kappa CC (with the cell surface glycoprotein that is expressed on the surface of helper T lymphocytes, cells of the monocyte/macrophage lineage and CC (MHC) class II molecules on the surface of antigen presenting cells to cells to cells. CD4 associates with major histocompatibility complex (munoconjugate is used to kil cells infected with HTV, and for treating CC (for staging or prognosis of infection, and for assessing efficacy of treatments). The immunoconjugate is also used for imaging HTV-infected tissues (for staging and prognosis of HTV infected patients. The (complex of infection burden, once determined, this information is used in the staging and prognosis of HTV infected patients. The (complex of infection) are assembled intracellularly and secreted efficiently from mammalian (colls, allowing high recovery and purification from the culture medium. They have longer half-life in serum and greater avidity than heavy chain (colls).

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       to a heterotetramer having two chimeric CD4-IGG2 heavy chains encoded by an expression vector CD4-IGG2HC-PRCCMV and two chimeric CD4-kappa light chains encoded by an expression vector CD4-kLC-PRCMV. The invention is useful for killing human immunodeficiency virus (HIV)-infected cells, for the treatment and prevention of infection with HIV

The present invention relates to a method for inhibiting infection of a CD4+ cell by HIV. The method comprises contacting the HIV with a CD4-IgG2 chimeric heterotetramer to form a complex with the HIV (CD4 = cluster of differentiation 4; IgG2 = immunoglobulin gamma 2). CD4 is a cell surface glycoprotein that is expressed primarily on the surface of T cells. In man, CD4 is the target of interaction with HIV. The heterotetramer has two heavy and two light chains which are encoded by expression vectors CD4-IgG2HC-pRcCMV (V1) and CD4-kLC-pRcCMV (V2), respectively. The method is used to inhibit infection of a CD4-cell by a HIV and to prevent CD4+ cells of a subject from becoming infected with HIV. The method is also useful for treating a subject having CD4+ cells infected with HIV. The present sequence is human fusion protein: CD4-gamma2 chimeric heavy chain
                                                                                                                                                                                                                                                                                                                                                                                                                                              Inhibiting human immunodeficiency virus (HIV) infection of a CD4+ or treating a subject having CD4+ cells infected with HIV involves CD4-IgG2 chimeric heterotetramer to form a complex with the HIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  N-PSDB;
Sequence 432 AA;
                                                homodimer. This sequence was used in the method of the present invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  2001-264981/27.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        heterotetramer (I) that neutralises human immunodeficiency virus-1 (HIV-1) having two heavy chains encoded by an expression vector designated CI-1gG2HC-pRcCMV, and two light chains encoded by expression vector designated CD4-kLC-pRcCMV. (I) and a composition (II) comprising (I) or (II) linked to a toxin, are useful for inhibiting HIV infection of a CD4-cell, and preventing a subject being infected with HIV by blocking the spread of HIV infection. This is the amino acid sequence of the CD4-gamma2 chimeric heavy chain of the CD4-IgG2 chimeric heterotetramer useful in inhibiting HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Novel CD4-immunoglobulin G2 chimeric heterotetramer neutralizes human immunodeficiency virus-1 with two heavy and light chains encoded by expression vectors designated CD4-IgG2HC-pRcCMV and CD4-kLC-pRcCMV, respectively.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             CD4; gamma2

This sequence represents a CD4-IgG2 chimeric heavy chain heterotetramer It was produced by expresion of the coding mutagenised cDNA (produced as described in AAQ28089) in Dhfr-CHO cells. The protein is efficiently assembled intracellularly and effectively secreted from mammalian cells pref. CHO, COS, or myeloma cells as a heterotetramer, enabling high recovery and purification from the medium of cells expressing it. It possesses increased serum half-life and has increased avidity for HIV cf. heavy chain dimers. It can inhibit HIV infection of CD4+ cells and block

CC sequence from the CD4-IgG2 chimeric heterotetramer. The invention relates to an immunoconjugate comprising a cytotoxic radionuclide and a CC heterotetramer of two heavy chains and two light chains. The cytotoxic radionuclide is linked to either the heavy chains or the light chains, or to all four chains, directly or through a bifunctional chelator. Both CC to all four chains are chimeric CD4-Ig (immunoglobulin) G2 chains encoded by vector CD4-KD2HC-pRCCMV (ATCC 75193) and both light chains are chimeric CD4-Ig (immunoglobulin) G2 chains are chimeric CD4-Ig (immunoglobulin) G2 chains encoded by vector CD4-KLC-pRCCMV (ATCC 75194). CD4 is a CC non-polymorphic cell surface glycoprotein that is expressed on the Surface of helper T lymphocytes, cells of the monocyte/macrophage lineage and dendritic cells. CD4 associates with major histocompatibility complex CC (MHC) class II molecules on the surface of antigen presenting cells to mediate efficient cellular immune response interactions. In humans CD4 is che target of interaction with the human immunodeficiency virus HIV. The immunoconjugate is used to kill cells infected with HIV, and for treating cor preventing infection. It is also used for imaging HIV-infected tissues (for staging or prognosis of infection, and for assessing efficacy of treatments). The immunoconjugate is also used to determine the HIV convelope glycoprotein burden, once determined, this information is used in the staging and prognosis of HIV infected patients. The convelope glycoprotein burden, once determined, this information is used in the staging and prognosis of HIV infected patients. The staging of interaction is essembled intracellularly and secreted efficiently from mammalian colors, allowing high recovery and purification from the culture medium. They have longer half-life in serum and greater avidity than heavy chain colling.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 New immunoconjugate, used to treat, prevent or image human : deficiency virus infection, comprises radionuclide attached heterotetramer of CD4-immunoglobulin chimeras.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This sequence

                                                                                                                                                                                                                                                                                                                                                                       The present invention relates to an immunoconjugate, comprising a cytotoxic radionuclide linked, directly or via a bifunctional chelator, to a heterotestramer having two chimeric CD4-IgG2 heavy chains encoded by an expression vector CD4-IgG2HC-pRcCMV and two chimeric CD4-kappa light chains encoded by an expression vector CD4-kLC-pRcMV. The invention is useful for killing human immunodeficiency virus (HIV)-infected cells, for the treatment and prevention of infection with HIV
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         Immunoconjugate for treating human immunodeficiency virus-infected subject, consists of cytotoxic radionuclide linked to heterotetramer comprising two chimeric CD4-IgG2 heavy chains and two chimeric CD4-kappalight chains.
                                                                                                                                                                                                                                                                                                                          Sequence 530
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; Fig 4; 43pp; English

The present invention relates to a method for inhibiting infection of a CD4+ cell by HIV. The method comprises contacting the HIV with a CD4-IgG2 chimeric heterotetramer to form a complex with the HIV (CD4 = cluster of differentiation 4; IgG2 = immunoglobulin gamma 2). CD4 is a cell surface glycoprotein that is expressed primarily on the surface of T cells. In man, CD4 is the target of interaction with HIV. The heterotetramer has
                                                                                                                                                                                                                                  Inhibiting human immunodeficiency virus (HIV) infection of a CD4+ cell, or treating a subject having CD4+ cells infected with HIV involves usin CD4-IgG2 chimeric heterotetramer to form a complex with the HIV.

The method is used to inhibit infection of a CD4+ cell by a HIV and to prevent CD4 cells of a subject from becoming infected with HIV. The method is also useful for treating a subject having CD4+ cells infected with HIV. The present sequence is human fusion protein: CD4-Ig2 chimeric heavy chain the CD4-IgG2 chimeric heterotetramer. This sequence was used in the method of the present invention

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention describes a purified CD4-immunoglobulin (Ig)G2 chimeric heterotetramer (I) that neutralises human immunodeficiency virus-1 (HIV-1) having two heavy chains encoded by an expression vector designated CD4-IGG2HC-pRcCMV, and two light chains encoded by expression vector designated CD4-kLC-pRcCMV. (I) and a composition (II) comprising (I) or (I) linked to a toxin, are useful for inhibiting HIV infection of a CD4 cell, and preventing a subject being infected with HIV by blocking the spread of HIV infection. This is the amino acid sequence of the CD4-immunoglobulin G2 chimeric heavy chain chimeric heterotetramer useful in inhibiting HIV infection
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 530 AA;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    This invention describes a novel nucleic acid (I) encoding a fusion protein comprising a DNA sequence encoding amino acids 1-173 of CD4 (II) and a DNA sequence encoding amino acids 1-173 of cD4 (II) and a DNA sequence encoding a human immunoglobulin (Ig) heavy or light chain (III). The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gp120. The fusion protein is useful for treating human immunodeficiency virus (HIV) or similar immunodeficiency virus (SIV). This sequence represents the fusion protein CD4Egammal which is constructed from CD4 linked to human IgG1 upstream of the hinge region
                                                                                                                                                                                                                                                                                                                                                                                                                                                          Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Example 1; Col 59-70;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      236
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    206
```

The invention provides a fusion gene encoding a fusion protein that comprises an extracellular CD4 DNA sequence or its fragment which binds to HIV gpl20 when fused to an immunoglobulin (Ig) chain and the DNA sequence of an Ig heavy or light chain, where the DNA sequence encoding the variable region has been replaced with the DNA sequence which encode

Example 1; Page 61-68; 89pp; English

                                           Genetic construct which encodes CD4 linked to human IgG1 at the site upstream of the CH1 region (fusion protein CD4H-gamma-1).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       extracellular CD4 or its gpl20 binding fragment. The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be used for treating HIV or SIV infections in humans. The present sequence represents the fusion protein CD4Bgammal where the CD4 is linked to human IgG1 at the Banl site downstream from the hinge region

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             The fusion protein genes of the invention pref. comprise cDNA sequences which encode CD4 or a fragment which binds gp120 ligated to an expression plasmid which encodes an antibody in which the variable region of the gene has been deleted (see WO87-02671). The CD4 portion of the fusion protein may comprise the complete CD4 sequence, the 370 AA extracellular region and the membrane spanning domain, or the extracellular region. The Ig heavy chain is pref. from IgM, IgG1 or IgG3. The following are specifically claimed: fusion proteins CD4H-gamma-1, CD4Mmu, CD4E-gamma1, and CD4Mmu (NO.67608), pCD4P-gamma (No.67608) and pCD4E-gamma. (No.67608) and pCD4E-gamma-1 (NO.67608) at the ATCC under accession number 67611. (Updated on 25-MAR-2003 to correct PA field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Example;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             N-PSDB; AAN90356

            The present sequence is that of fusion protein CD4Hgammal comprising textracellular portion of CD4, which binds to HIV gpl20, linked at its terminus to the human IgG1 heavy chain. To obtain the fusion protein, encoding CD4 was linked to IgG1 DNA at the Hind3 site upstream of the region (see AAA50660). Pusion protein CD4Hgammal and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucl
                                                                                                                                                                                                                                                                                                    CD4-immunoglobulin SIV.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          09-JAN-2001

The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgGl fusion proteins such as CD4Hgammal provide both complement-mediated and cell-mediated immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Sequence

                                                                                                                                                                                                                                                                                                                                                                                                                       The invention provides a fusion gene encoding a fusion protein that comprises an extracellular CD4 DNA sequence or its fragment which binds to HIV gp120 when fused to an immunoglobulin (Ig) chain and the DNA sequence of an Ig heavy or light chain, where the DNA sequence encoding the variable region has been replaced with the DNA sequence which encodes extracellular CD4 or its gp120 binding fragment. The fusion protein is capable of being secreted. The fusion proteins are useful for treating HIV or SIV infections in animals, preferably humans. They are also useful for producing medicaments which can be used for treating HIV or SIV infections in animals, preferably humans they are also useful infections in humans. The present sequence represents the fusion protein CD4Hgammal where the CD4 is linked to human IgG1 at the Hind3 site

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            A tetramer comprising 2 IgG2 heavy chains or two CD4-IgG2 chimeric heavy chains and two kappa light chains or CD4-kappa light chains (AAR4680) linked to a non-peptidyl toxin or a gamma radiation-emitting radionuclide of low to moderate cytocoxicity. The resulting immunoconjugate comprising the toxin can be used to kill HIV infected cells and to treat HIV infected subjects to reduce the population of HIV infected cells. It can also be used to reduce the population of HIV infected cells. It can comprising the radionuclide can be used to image HIV infected tissue, to calculate the stage of HIV infection or the efficacy of an anti-HIV treatment using the imaging technique and for determining the prognosis of an HIV infected subject.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   This invention describes a novel nucleic acid (I) encoding a fusion protein comprising a DNA sequence encoding amino acids 1-173 of CD4 (II) and a DNA sequence encoding a mino acids 1-173 of CD4 (II) and a DNA sequence encoding a human immunoglobulin (Ig) heavy or light chain (III). The products pf the invention have anti-human immunodeficiency virus (HIV) activity and are capable of binding to gp120. The fusion protein is useful for treating human immunodeficiency virus (HIV) or simian immunodeficiency virus (SIV). This sequence represents the fusion protein CD4H-1 which is constructed from CD4 linked to human IgG1 upstream of the CH1 region

                     The fusion protein genes of the invention pref. comprises cDNA sequences which encode CD4 or a fragment which binds gp120 ligated to an expression plasmid which encodes an antibody in which the variable region of the gene has been deleted (see Wo87-02671). The CD4 portion of the fusion protein may comprise the complete CD4 sequence, the 370 AA extracellular region and the membrane spanning domain, or the extracellular region. The 19 heavy chain is pref. from IgM, IgG1 or IgG3. The following are specifically claimed: fusion proteins CD4Hlambda1, CD4Fmu, CD4Elambda1, and CD4Mmu (No. 67608), pCD4Plambda (No. 67609) and pCD4Elambda1 (No. 67610). (Updated on 25-MAR-2003 to correct PA field.)

To obtain the fusion protein, DNA encoding CD4 was linked to IgG1 DNA at the Bani site downstream of the hinge region (see AAA50664). Fusion protein CD4Bgammal and a nucleic acid encoding it are claimed. Also claimed are a vector comprising the nucleic acid, and a method of producing the fusion protein in secreted form using a transformed host cell. The fusion protein may further comprise a therapeutic agent, radiolabel or NMR imaging agent. The fusion protein can be administered to an animal (including humans) for treatment of HIV or SIV infection, and can also be used in assays for HIV or SIV, imaging and tissue stains. IgG1 fusion proteins such as CD4Bgammal provide both complement-mediated and cell-mediated immunity
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Sequence 616 AA;

                                                  CC A novel T lymphocyte veto molecule is a chimeric molecule comprising a CC protein, e.g. the present sequence, linked to a targetting polypeptide CC that binds a molecule, which differentiates a host cell from a tissue CC graft cell, or selectively targets a stimulator cell involved in the CC autoimmune response. A veto molecule, in which the protein binds a CC molecule that targets stimulator cells, can be used to suppress an immune CC response and therefore treat autoimmune diseases, e.g. systemic lupus CC erythematosus, myasthenia gravis, rheumatoid arthritis, insulin dependent CC diabetes mellitus, multiple sclerosis, coeliac disease, autoimmune CC allergies and other immunological disorders. Where the protein binds a CC molecule that differentiates graft and host cells, the veto molecule can be used to reduce transplant rejection. The veto molecule provides specific regulation of particular stimulator cells that can kill graft CC cells or respond to autoantigens, but leave other stimulator cells can ceffected, e.g. CD4 or CD8 positive cells can be regulated without one minimise generalised immunosuppression
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 g
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       5

```
Nucleic acid sequences for production of CD4 chimeric protein - used to transfect streptomyces, contg. LTI signal sequence linked to pro-peptide sequence facilitating peptide cleavage.
```

English.

The sequence was deduced by sequencing the plasmid vector VIV2-hCH2- KA CC in S. lividans strain 1326. The protein has domains contg. peptides of CC different function. It contains a CD4 chimera (VIV2) in which the carboxy terminal portion of the protein consists of a murine immunoglobulin light CC chain constant region, linked to the signal peptide of Streptomyces LTI, CC modified at its N-terminus to include Lys-Arg. Also included is the IgG1 CC constant region comprising the hinge and CH2 metotifs. Human IgG1 is the CC complement and ADCC. The CD4 chimeric proteins may be expressed in CC complement and ADCC. The CD4 chimeric proteins may be expressed in CC complement, and the LTI CD4 protein increases the stability of the CD4, CC thus increasing the serum half life and/or potency against HIV infection CC and inhibit virus-induced cell fusion, relative to soluble CD4. By CC altering only one amino acid at position 2 near the N terminal of CD4 (VI region) from Lys to Ala, a heterologous protein is expressed which is cfficiently secreted and correctly processed to remove the entire LTI CC signal sequence, but which still retains the gp120 binding capacity. By condifying the pro-peptide you avoid deleterious effects of additional CC amino acids on the function of the protein. See also AAR20635,6

Alternatively the transmembrane region of the chimeric receptor contains a portion of the CD7, CD5 or CD3 transmembrane domains. The extracellular portion of the chimeric receptor contains a fragment of CD4 (amino acids 1-394 or 1-200 of the CD4 sequence) which specifically recognises and binds HIV-infected cells, but does not mediate HIV infection. The extracellular domain of the receptor is separated from the cell membrane by 48 or 72 angstroms, or by one or more proteinaceous alpha-helices. The cells expressing the receptor are preferably T cells, B cells, neutrophils, or dendritic cells. The therapeutic cells expressing the chimeric receptor are administered to a

                                                                                                                                                                                                                                                                                                                                                Human IgG1 hinge, CH2 and CH3 domains (AAR78668) are used in the construction of a chimeric receptor utilised in the targeted cytolysis HIV-infected cells. The chimeric receptor comprises the extracellular domain (pref. amino acids 1-394 or 1-200) of CD4 linked via the CD7 transmembrane domain to an intracellular portion, e.g. of T-cell recept protein zeta. The IgG1 portion of the chimeric receptor is encoded by DNA sequence given in AAQ96101
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Seed

                                                                                                                                                                                            monoclonal antibodies, for selection of those with affinity for particular antigens and useful for diagnostic or therapeutic use. Libraries of T cell receptors may also be prepared. The method produces libraries of high diversity; provides easy, quick and automatable selection from a large number of proteins, allows relatively simple alteration of the expressed gene (e.g. fusion to other protein-coding sequences), is suitable for large scale protein production and allows simple verification and characterization of selected cell lines. The method does not require incorporation of a resistance marker. This sequence represents the construct pBS loxP-1gG1/bBS loxP-1gG1delta350/pBS loxPIgGdeltaCH1 described in the disclosure of the invention.
                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel method of preparing a library of protein producing sukaryotic cells comprising (a) introducing specific recombination signals into one or two chromosomal gene loci, (b) Expanding at least one of the modified cells, (c) Transfecting many different DNA sequences, each flanked by recombination signals, into the expanded cells and (d) Integrating the DNA sequences into the gene loci on the basis of the recombination signals and the appropriate recombinase. The resulting cells express different proteins, each from an integrated DNA sequence and the proteins are bound to the cell surface. The method is particularly used to produce libraries of humanized monoclonal antibodies, for selection of those with affinity for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                Key

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CC This invention describes a novel method of preparing a library of protein producing eukaryotic cells comprising (a) introducing specific cc recombination signals into one or two chromosomal gene loci, (b) CC Expanding at least one of the modified cells, (c) Transfecting many cc different DNA sequences, each flanked by recombination signals, into the expanded cells and (d) Integrating the DNA sequences into the gene loci con the basis of the recombination signals and the appropriate cc recombinase. The resulting cells express different proteins, each from an integrated DNA sequence and the proteins are bound to the cell surface. CC integrated DNA sequence and the proteins are bound to the cell surface. CC integrated DNA sequence and the proteins are finity for monoclonal antibodies, for selection of those with affinity for particular antigens and useful for diagnostic or therapeutic use. CC Libraries of T cell receptors may also be prepared. The method produces clibraries of high diversity; provides easy, quick and automatable constrained of the expressed gene (e.g. fusion to other protein-coding sequences), is suitable for large scale protein production and allows called verification and characterization of selected cell lines.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                The invention relates to a novel concatameric protein comprising two soluble domains, in which an N-terminus of a soluble domain of a biologically active protein is linked to a C-terminus of an identical soluble domain or a different soluble domain of a biologically active protein. The methods and compositions of the present invention are useful for the diagnosis and treatment of disorders associated with dimeric
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     New concatameric protein having two soluble domains, useful for diagnosing and treating disorders associated with the dimeric pits glycosylated form, such as inflammation, septicemia, rheumanthritis and cachexia.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       protein or its glycosylated form, such as inflammation, septicaemia, cytotoxicity, rheumatoid arthritis, cachexia and other inflammation-related diseases. This sequence represents the human concatameric protein
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        of the invention

MAb 447-52D was found to recognise the tetrapeptide motif GPGR, i.e. the Principal Neutralising Determinant common to the V3 loop of different HIV isolates. A recombinant Ab was produced in which the H chain V region was derived from 447-52D and to which a signal sequence and a H chain intronic sequence are appended, fused to a fragment contg. a short intronic sequent of the human gamma 1 crooding domain in its genomic form. (Updated on 25-MAR-2003 to correct PN field.)
